

# SUGARCUBE™

## SugarCube Recording Guide

**What's new as of version 2.3-650**

**For SugarCube Models: SC-2, SC-2svnr, SC2-Mini,  
SC2-Mini/Phono, SC2-Plus**

# SugarCube Recording Guide

**Version 2.3-650+ of June 27, 2022**

1. File saving while using the desktop app no longer has extraneous tag on file name.
2. Additional internal bug fixes mostly addressing file saving.
3. On SC-Plus series, when using the Plus as your ADC/DAC with an external computer, recording and playback gain now calibrated.
4. Message windows no longer require confirmation.

# SugarCube Recording Guide

Version 2.3-563 of Dec 29, 2021

1. Audio playback in track editing has much less latency, playback starts much quicker.
2. Internal bug fixes mostly addressing file saving.
3. USB drives formatted as FAT32 that are greater than 64GB cannot be used for file saving due to a limitation of the SugarCube's Linux operating system. There is currently no OS patch or software trick that we can apply to get around this so please use exFAT or NTFS for larger drive sizes.
4. Message windows for confirmations or errors have been reworked and are more readable.

# SugarCube Recording Guide

Version 2.3-452 of Oct 25, 2021

1. Major overhaul of the saving to USB process with more accurate measurement and tracking of remaining space on external drives, among many other improvements.
2. For USB storage, each session's 'SugarCube' output folder on the USB drive is time stamped.
3. The output to USB process now pre-calculates the space required on the attached USB drive. If insufficient, an alert message appears and the output processing will not proceed until corrected.
4. Speaking of which, there are now new pop-up message windows throughout with easier to understand dialog and button choices.
5. All user settings are now persistent (they stay where you left them last.)
6. We also discovered that sometimes when a USB stick is formatted on a PC and then plugged into the SugarCube, the Linux OS inside the SugarCube sees the drive as read-only and nothing happens when trying to save recordings. We believe that we found a way to overcome that problem.
7. Many internal fixes for better stability and faster operation.

# SugarCube Recording Guide

Version 2.3-400+ of Oct 3, 2021

1. Major overhaul of file saving process with more feedback on the user interface on the process steps which is especially useful with large workloads.
2. New '**System**' button to clear file download work area should any download session get stuck.
3. File output pre-processing now checks for zero-length tracks (no audio) and will not save tracks of a recording if any tracks have no audio, you will need to go back to the editor and delete any empty tracks (but you can always save the whole album side.
4. Pre-processing also checks for missing artist or album info and will not save either the album side nor tracks if this data is missing.
5. You can now choose to have the first track flag and the final track flag set the in and out points when saving whole album sides. This is especially useful when the the recording runs past the end of the LP. Also allows gets rid of needle drop noise.

# SugarCube Recording Guide

Version 2.3-300 of Aug 27, 2021

1. Recording count moved back to **10** from **12**. We apologize for this change but there were too many problems with users saving WAV or AIFF that caused overflows. We plan to rework storage so the number of LPs that can be recorded will be based on time and sample rate which will provide much more flexibility, coming soon.
2. New '**System**' tab added to '**Settings**' to control some system functions including how long the front panel display remains on, among other controls.
3. "**VU Meter**" added a to '**Settings**' page on '**Input Level**' tab.
4. New **Startup Screen** shows the SugarCube startup progress to know when it is ready to use after power on.
5. New requirement to **power cycle** the SugarCube when a new update is installed. You will see a message to announce a new download is ready and to please power off, count to 3, then back on to complete the update process.

# SugarCube Recording Guide

Version 2.3-127 of July 2, 2021

1. **Detecting more than 10 recordings.** Starting recording from the front panel or from the app/browser, will not work if the storage area is full. From the front panel, recording will not start until you go to the recording page and finishing processing a recording and save and/or just delete one. From the browser, you will be given the choice to proceed which **automatically deletes the oldest recording** or, to **not proceed with recording**. Anytime the count of recordings is less than twelve, recording will work from the front panel or app/browser as normal.
2. **Recordings shorter than 20 seconds are automatically deleted.** If you drop the needle and it skips or does not hit the lead in properly and you stop the recording, this will leave a zero-length file in storage which uses up one of your twelve recording spaces. We now detect and automatically delete the file.
3. Minor software bug fixes and security updates on behind-the-scenes code.
4. NOTE: **after an update**, please turn **power off** then count to three and **power back on**.
5. The user interface works in **Google Chrome, Apple Safari, Microsoft Edge**. NOTE: we love Firefox and all the efforts at Mozilla for creating great software (they are our neighbors here in Mountain View, CA.) However, Firefox uses a slightly different interpretation of certain browser languages that execute the SugarCube interface causing errors in displaying our menus. We hope the situation improves as it did with Apple and Microsoft.)
6. If you contact support, please send us you device's **serial number** and **current version of software**.

# SugarCube Recording Guide

1. **Clipping indicator** has been carefully recalibrated. If you see a yellow **Clipping Warning** pop-up, the audio has not yet clipped but is right on the edge. If you see a red **Clipping Error** (while audio is playing) the audio has clipped. In either case, you should go to the **Settings** menu and select **Line-In Level** one step lower. Note, the clipping message stays visible for about 10 minutes or until you click on it to clear it.
2. Further work on stability of recording, pre-processing, and the speedy saving of files.
3. IMPORTANT: Recording and file saving are now completely separated processes. While active, **Recording** will lock out the **Pre-Processing** step for file saving. Likewise, if **Pre-Processing** is running, it will lock out **Recording** until it is finished. This is to prevent overloading the SugarCube's CPU and protects the quality of both processes.
4. Reiterating: added option to both **Track Format** and **Side Format** pages to "**Group all tracks or sides of the same album?**" when saving away from the SugarCube (meaning when saving other than to a USB device plugged into the unit.)
5. NOTE: **after an update**, please turn **power off** then count to three and **power back on**.
6. The user interface works in **Google Chrome, Apple Safari, Microsoft Edge**. NOTE: we love Firefox and all the efforts at Mozilla for creating great software (they are our neighbors here in Mountain View, CA.) However, Firefox uses a slightly different interpretation of certain browser languages that execute the SugarCube interface causing errors in displaying our menus. We hope the situation improves as it did with Apple and Microsoft.)
7. If you contact support, please send us you device's **serial number** and **current version of software**.

# SugarCube Recording Guide

1. Fixed album art importing from Discogs in response to Discog's protocol change.
2. Fixed 'Start Process' button on Pre-Process page (was unintentionally intermittently disabled)
3. Added option to both Track and Side Format pages to "**Group all tracks or sides of the same album?**" when saving away from the SugarCube (meaning when saving other than to a USB device plugged into the unit.)
4. Finally, years in the making: FAST FILE SAVING!!!
5. Now, you can save recordings in 1/10 the time anywhere on your laptop or on your home network.
6. Cleaned up and updated user interface.
7. NOTE: **after an update**, please turn **power off** then count to three and **power back on**.
8. NOTE: **after an update**, please **reload** (refresh) the browser page (semicircle arrow to the left of the address field.)
9. User interface works in **Google Chrome, Apple Safari, Microsoft Edge**.
10. If you contact support, please send us you device's **serial number** and **current version of software**.

# SugarCube Recording Guide

1. External DAC selection now operates reliably across most USB2-based DACs
2. Better filtering of incoming Discogs data to fix missing start/end flags.
3. More reliable track saving (much faster track saving coming soon.)
4. NOTE: **after an update**, please turn power off then count to three and power back on.
5. If you contact support, please send us you device's **serial number** and **current version of software**.

# SugarCube Recording Guide

1. Mainly corrected a host of minor software issues
2. Track and album side saving normalization adjustment to produce what is expected
3. File saving is more stable
4. Album and track processing time prior to saving reduced by 33%
5. User interface cleaned up and new color scheme applied
6. NOTE: **after an update**, please turn **power off** then count to three and **power back on**.
7. NOTE: **after an update**, please **reload** (refresh) the browser page (semicircle arrow to the left of the address field.)
8. If you contact support, please send us you device's **serial number** and **current version of software**.

# SugarCube Recording Guide

## 1. SC-1/2svNR updated SugarCubes:

Noise Reduction / Equalization is now fully functional for both live listening as well as track saving from recordings

## 2. SC2 track saving from recordings now byte accurate for gapless playback

## 3. Fixed metadata tagging in AAC, ALAC, MP3

## 4. Simplified pairing codes: whenever a **pairing code** is requested, just enter '**1111**'

## 5. All SugarCubes will now start up in '**Bypass**' or after an update to better protect your sound system.

## 6. NOTE: **after an update**, please turn power off then count to three and power back on.

## 7. If you contact support, please send us you device's **serial number** and **current version of software**.

# SugarCube Recording Guide

1. Fixed normalization when saving files.
2. Removed display flashing when using Google Chrome browser
3. Renamed 'Delete All' to 'Clear Recording Storage Area' which is faster and more thorough.
4. You can now save 10 sides in the internal SugarCube recording cache.
5. The SugarCube recording system now provides vinyl LP information from the **Discogs** community.
6. You can search by '**catalog number**' or by '**artist, album**'.
7. Saved recordings to your local device (personal computer or music server) are now **date & time stamped** for easier file management.
8. Added '**Delete All**' to 'Recordings to Edit' window.
9. All SugarCubes will now start up in '**Bypass**' or after an update to better protect your sound system.
10. Fixed album art mismatch between LCD display on SugarCube and web UI.

# SugarCube Recording Guide

Version 2.1 of March, 2020

1. **"Save Changes"** has been removed, your edits are automatically updated as you make changes.
2. **"Progress Bar"** has been removed from the save tracks section. The algorithms that do all of the pre-processing are not predictable enough to be of use.
3. **AIFF and ALAC format** has been fixed to save at any allowable sample rate and word size.
4. **Simplified pairing:** you can now enter "1111" (or the last four digits of your SugarCube model number if you own more than one SugarCube) as a pairing code. No more need to press the pairing button!
